CONFIGURATION

Each Ceph process, daemon or utility draws its configuration from several sources on startup, include a local configuration, the monitors, the command line, or environment variables. Configuration options may be set globally such that they apply to all daemons, to all daemons or services of a particular type, or only to a specific daemon, process, or client.

CONFIGURING THE OBJECT STORE

For general object store configuration, refer to the following:

- Storage devices
- Configuring Ceph

REFERENCE

To optimize the performance of your cluster, refer to the following:

- Common Settings
- Networks
- Monitors
- Authentication
- OSDs
- Heartbeats
- Logs / Debugging
- Example ceph.conf
- Running Multiple Clusters
- Network Settings
- Auth Settings
- Monitor Settings
- Looking op Monitors through DNS
- Heartbeat Settings
- OSD Settings
- BlueStore Settings
- FileStore Settings
- Journal Settings
- Pool, PG & CRUSH Settings
